The Comprehensive Osteopathic Medical Achievement Test (COMAT) is a series of educational tools to assess the scope of knowledge for osteopathic medical school students at the end of their clinical rotation.

This Performance Profile reports a standard score for the total test and a graphic representation of performance on content areas. The standard score has a mean of 100 and a standard deviation of 10, based on a national sample of examinees. A Total Score above 107 indicates a good performance or a good understanding of the major medical problem-related scientific knowledge for the subject. A score between 93 and 107 indicates an average performance, and a score below 93 indicates a below-average performance.

The graphic presentation provides performance information on content areas using three categories: Lower Performance, Average Performance, and Higher Performance. An examinee may use this performance profile to assess his/her strengths and weakness. The width of the bands varies according to the precision of measurement: narrower bands reflect greater precision. An arrow indicates that the performance band extends beyond the displayed portion of the scale. Please note that **the accuracy of performance categories on specific content areas is limited** due to the relatively small number of items in each content area. Any performance band not showing on a content area indicates insufficient data to provide meaningful information.
